This invention relates to nucleic acid sequences AAF93744 - AAF93916
which encode human secretory or membrane proteins represented by AAB88317
CAAF62232 - AAF62235 which are used to isolate the CDNA sequences of the invention. The invention also includes methods for the production of antibodies directed against the proteins, and cDNA sequences, which can the used in vaccines. The polynucleotide sequences can be used in gene therapy. The polynucleotide sequences and the production of the prevention, treatment and diagnosis of diseases associated with inappropriate secretory protein/membrane protein expression. The nucleic acids and complementary sequences may also be used as DNA probes of in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect the presence of similar nucleic acid sequences in samples. They may also be used to study the expression and function of secretory proteins/membrane polypeptides and their role in metabolism. The gainst them and in assays to identify modulators (agonists and antagonists of expression and activity. The antibodies and antagonists of activity. The antibodies may also be used as therapeutic agents to down regulate expression and activity. The antibodies and antagonists of activity. The antibodies may also be used as therapeutic agents to down regulate expression and activity. The antibodies may also be used as therapeutic agents to down regulate expression and detecting the presence of the polypeptides in samples (e.g. by enzyme conting the presence of the polypeptides in samples (e.g. by enzyme the turbed architits and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding secretory proteins/membrane proteins, useful in gene therapy or as candidate target molecules in drug development.
                                                                                                                                                                                                                                                                                           Human; secretory protein; membrane protein; vaccine; gene therapy;
rheumatoid arthritis; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hayashi K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; SEQ ID NO 212; 609pp + Sequence Listing; English.

alternating blocks of fibroin and elastin ice e.g. a suture to keep separated viable form a device e.g. a comprising Protein polymer units - used to

Example 1; Page 27-30; 46pp; English.

The sequences represented by AAR80251-R80257 are polymers constructed of repeating blocks of fibroin-like (see AAR80249) and elastin-like (see AAR80250) units. This sequence contains 13 repeats of a block consisting of 8 alastin-like repeats followed by 6 fibroin-like repeats. The DNA sequences encoding these polymers were inserted into plasmids which were used to transform E.coli strain EC3. The polymers could then be isolated from the fermented strains BC3. The polymers could then be isolated to polymers are used to form a device (such as a suture, pin, thread, gel or polymers are used to form a device (such as a suture, pin, thread, gel or film) to keep separated viable tissue together. By varying the the ratio of the two repetative units, and by altering the lengths of the blocks of cach of them, the tensile properties of the polymer can altered moderatly. By reducing the number of repeating units of this sequence, or the or resorption can be achieved. Of the polymers, SELPO (see AAR80251) and the fastest resorption rate. The SELPA (see AAR80255) and SELP5 (see AAR80255) polymers showed intermediate resorption. No data was given for three polymers showed intermediate resorption. No data was given for (see AAR80257)

The present invention describes a composition (C1) comprising: (a) a protein polymer of at least 15kDa which comprises alternating blocks of protein crystallisation, and an amino acid sequence which promotes croprotein crystallisation, and an amino acid sequence which is an elasting protein crystallisation, and an amino acid sequence which is an elasting composition crystallisation, and an amino acid sequence which is an elasting composition dependent, a collagen-like element or a keratin-like element, and (b) like element, a collagen-like element or a keratin-like element; and (b) composition acquires a non-liquid comprision comprision comprision of administering of the biologically active substance to a localized site in vivo, comprising administering composition is used for the controlled release of biologically active compounds in vivo. It can also be used to alter the physical dimensions compounds in vivo. It can also be used to alter the physical dimensions compounds in the present sequence represents a protein polymer block amino acid sequence from the present invention

RESULT 28 AAR80252 Synthetic.

```
The sequences represented by AAR80251-R80257 are polymers constructed of repeating blocks of fibroin-like (see AAR80249) and elastin-like (see AAR80250) units. This sequence contains 13 repeats of a block consisting of 8 elastin-like repeats followed by 4 fibroin-like repeats. The DNA coll strain Eds. The polymers could then be isolated to used to transform E. coll strain Eds. The polymers could then be isolated from the fermented strains by standard centrifugation techniques. The polymers are used to form a device (such as a suture, pin, thread, gel or from the sep separated viable tissue together. By varying the the ratio of the two repetative units, and by altering the lengths of the blocks of each of them, the tensile properties of the polymer can altered moderatly. By reducing the number of repeating units of this sequence, or moderatly. By reducing the number of the polymer sation (see AAR80251) had the fastest resorption rate. The SELP4 (see AAR80255) and SELP5 (see AAR80255) polymers showed no resorption after seven weeks. The other three polymers showed intermediate resorption. No data was given for SELP6 (see AAR80257)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   54;

The composition acquires a non-liquid form under physiological conditions. Also described: (1) delivering a

biologically active substance to a localized site in vivo, comprising administering C1, where the biologically active substance is delivered from the non-liquid to the localized site; and (2) altering the physical dimensions of a body tissue of a mammal, comprising administering a C1. The composition is used for the controlled release of biologically active compounds in vivo. It can also be used to alter the physical dimensions of a body tissue. The present sequence represents a protein polymer block amino acid sequence from the present invention

The sequences represented by AAR80251-R80257 are polymers constructed of repeating blocks of fibroin-like (see AAR80249) and elastin-like (see AAR80250) units. This sequences contains 18 repeats of a block consisting of 8 elastin-like repeats followed by 2 fibroin-like repeats. The DNA sequences encoding these polymers were inserted into plasmids which were used to transform E.coli strain EC3. The polymers could then be isolated from the fermented strains by standard centrifugation techniques. The polymers are used to form a device (such as a suture, pin, thread, gel or polymers are used to form a device (such as a suture, pin, thread, gel or film) to keep separated viable tissue together. By varying the the ratio of the two repetative units, and by altering the lengths of the blocks of each of them, the tensile properties of the polymer can altered moderally. By reducing the number of repeating units of this sequence, or by increasing the number of units of the elastin like repeat, a faster rate of resorption can be achieved. Of the polymers, this sequence had the fastest resorption rate. The SELP4 (see AAR80255) and SELP5 (see BAR80257) and SELP5 (see BAR80257) and SELP5 (see BAR80257)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protein polymer comprising alternating blocks of fibroin and elastin units - used to form a device e.g. a suture to keep separated viable
                                                                                      Fibroin; elastin; repeat sequence; suture; thread; pin; gel; silk; polymer; E.coli; EC3.

Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated application derivative SHELIZE-36

```
This represents the human elastin sequence containing the minimal functional unit (MPU)-1 polypeptide of the invention. This MFU-1 is a polypeptide that has at least 3 beta-sheet/beta-turn structures, but is not a naturally occurring fibrous protein. Each beta-sheet structure has cont a naturally 5-7) amino acids and the MFU polypeptide may include at 3-7 (preferably 5-7) amino acids and the MFU polypeptide may include at can also be derived from the sequences of animal elastin, lamprin and can also be derived from the sequences of animal elastin, lamprin and spider silk protein. The MFU polypeptides are self-aligning peptides capture used to coat prostheses made of animal or synthetic material or They are used to coat prostheses made of animal or synthetic material or comparable to the MFU as as blood vessel or heart valve replacements, metal, particularly for use as blood vessel or heart valve replacements.

Con high-tensile strength materials, e.g. ropes or parachute cord.

Cor high-tensile strength materials, e.g. ropes or parachute cord.

Cor high-tensile strength anterials, e.g. ropes or parachute cord.

Cor high-tensile strength materials, e.g. ropes or parachute cord.

Cor high-tensile strength materials, e.g. ropes or parachute and produce cordinate, homogeneous material and are easier to manipulate and produce than full-length elastins. They are non-thrombosogenic and non-immunosperic than full-length elastins. They are non-thrombosomic and non-immunosperic properties to be tailored for particular applications, e.g. combining the properties to be tailored for particular applications, e.g. combining the properties to be tailored for particular applications, e.g. combining the properties to be tailored for particular applications, e.g. combining the properties to be tailored for particular applications, e.g. combining the properties to be tailored for particular applications, e.g. combining the properties to be tailored for particular applications, e.g. compared to the properties to be tailored for part

The present sequence represents a human tropoelastin splice form. The specification describes tropoelastin derivatives, in which a subsequence specification describes tropoelastin derivatives, in which a subsequence of eliminated, or a subsequence has been inserted so that susceptibility to eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced elementary is an end an be used where the wild-type protein would be cusceptibility, and can be used where the wild-type protein would be cropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivatived protease-susceptibility sites, are useful containing in human or veterinary medicine, cosmetics (e.g. antiwrinkle or hand conting in human or veterinary medicine, cosmetics (e.g. antiwrinkle or hand conting agents and for inducing chemotaxis. They are also useful for proliferation or growth inhibition, particularly of smooth containing conting the protease of cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by competases, or to limit protease activity that causes blood clotting ax
                                                                                                    Tropoelastin; derivative; proteolysis; protease; antiwrinkle; hand lotion; bulking agent; chemotaxis; proliferation; growth inhibition; peptidomimetic; lung damage; elastin; cancer; metastasis; blood clotting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New derivatives of tropoelastin useful, e.g. for inducing chemotaxis and

The invention describes a polypeptide (I) comprising a minimal functioning unit (MFU) which is present in the sequence of human elastin correctioning unit (MFU) which is present in the sequence of human elastin corrections are tructures, and at elast constitutions of a residue that participates in cross-linking, and not construct human elastin-like prostheses such as tubes for blood vessel construct human elastin-like prostheses such as tubes for blood vessel control of the promote healing. MFUS can be co-aggregated with other proteins, for e.g. collagen, to provide prosthesis material that corresembles the natural structural materials of the body. MFUS modeled on resembles the natural structural materials of the body. MFUS modeled on resembles the natural structural materials of the body. MFUS modeled on a variety of materials, for a number of different applications, for e.g. in cords and ropes for use in parachutes and in cosmetics. Coating synthetic prosthesis with MFUS modeled on human elastin significantly synthetic prosthesis with MFUS modeled on human elastin significantly containing materials. In contrast correctioning is a single consultable fragments of elastin used before, an MFU is a single pertite of defined composition. The MFU is considerably smaller than the parent protein, simpler in structure, easier to produce or expression. Containing through the parent protein, simpler in structure, easier to produce or expression. The monopeal composed entirely of a human elastin sequence, MFU is non-thronded entirely of a human elastin sequence, MFU is non-thronded entirely of a human elastin sequence, mFU is non-immoral and entire and provides a friendly environment for cell infilation.
                                                                                                                                                                                                                                                      Novel polypeptide useful in prosthesis, has a secondary structure characterized by three beta-sheet/beta-turn structures, and is not naturally occurring fibrous protein.
                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Fig 1B; 21pp; English

This invention describes a polypeptide that comprises three beta sheet/beta turn structures and that is not a naturally occurring fibrous protein. The invention also describes a prosthesis comprising an animal, protein. The invention also describes a prosthesis control animal, or synthetic material comprising the polypeptide, an elastic material comprising the polypeptide, a high tensile strength material comprising the polypeptide, and the polypeptide comprising the or material comprising the or material comprising the or material comprising of a portion of the polypeptide comprising at least three beta sheet/beta turn portion of the polypeptide consisting essentially of a portion of the polypeptide consisting essentially of a portion of the polypeptide consisting essentially of a portion of an animal elast in comprising at least three beta sheet/beta turns, and (d) a cell amprin comprising at least three beta sheet/beta turns, and (d) a colypeptide consisting essentially of a spider silk protein comprising at least three beta sheets/beta turns, and (d) a cell amprin comprising at least three beta sheets/beta turns, a polypeptide having the primary structure of a portion of a naturally occurring three beta sheets/beta turns, a polypeptide is not a naturally occurring about 7 amino acids and the polypeptide is not a naturally occurring about 7 amino acids and the polypeptide is not a naturally occurring construct human elastin-like prostheses such as wound or burn bealing. Alternatively the MFU can be co-aggregated with other proteins, for example collagen, to provide prosthesis material that resembles the natural structural materials of the body. The MFU based material is such endothelial cells, and the prosthesis can become a permanent living containing materials is more biocompatible than other elastin . 0 Polypeptide for constructing human elastin-like prostheses such as tubes for blood vessel replacement and sheets for other uses such as wound or burn healing, comprises three beta sheets and three beta turns. The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells contraining vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives for hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated sequence of the synthetic human tropoelastin SHEL
                                                                                                                                                                                                                        New derivatives of human tropoelastin - with elastin-like or macromolecular binding properties, useful e.g. as surgical implants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 AAAGLGAGIPGLGVGVPGLGVGAGVPGLGVGAGVPGFGAGADEGVRR

continuer compilers: a creatment or rneumatona arthritis; identification of genes for targeting in the treatment of rheumatoid arthritis in a mammal other than a mouse; diagnosis of rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; diagnosis or cefficacy of a candidate drug in vitro for the treatment of collagency of a candidate drug in vitro for the treatment of collagency induced arthritis, and reducing the symptoms associated with collagency arthritis. The compositions of the invention have the following activities: immunosuppressive, antirheumatic, antiarthritic, osteopathic, antigout, antiinflammatory dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as the interval disease caused by an infectious agent. This sequence represents of immune disease caused by an infectious agent. This sequence represents of autoimmune diseases or arthritides. Note: This sequence represents of autoimmune diseases or arthritides. Note: This sequence is not shown of antoimmune diseases or arthritides. Note: This sequence is not shown or with the specification. It has been supplied in an electronic format from
The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a patient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that gene expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention further comprises: a treatment of rheumatoid arthritis; identification of further comprises:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tropoelastin; hTE; elastin; glycosaminoglycan; GAG-binding; medical; pharmaceutical; veterinary; cosmetic application; anti-wrinkle; food; hand lotion; surgical implant; industrial product; human; SHEL; variant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        \delta
                                                                                                                             The present invention relates to the use of an agent that promotes clastin signaling in smooth muscle cells for decreasing or preventing occlusion of a body vessel by smooth muscle cells, decreasing vascular obstruction, promoting actin stress fiber formation or actin obstruction, increasing F:G actin ratio in a smooth muscle cell; of polymerisation, increasing F:G actin ratio in a smooth muscle cell; of creating or preventing obstructive vascular disease (e.g. restenosis), or preventing stenosis. The agent that promotes elastin signaling in smooth muscle cells; decreasing vascular obstruction, promoting actin stress fiber formation or actin polymerization, increasing F:G actin ratio in a smooth muscle cell; treating or preventing obstructive actin ratio in a smooth muscle cell, treating or preventing obstructive vascular disease (e.g. restenosis following analyplasty), or preventing treatment or preventing a medicament for the treatment or prevention of cclusion of a vessel. The present sequence is the human tropoelastin protein as shown in the exemplification of the

The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-products. The hybrid protein have controllable GAG-binding properties, products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHED26-36 excluding exon 26A product

New derivatives of tropoelastin useful, e.g. for inducing chemotaxis and growth

Disclosure; Page 134-135; 136pp; English.

The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a increased. The derivatives have with reduced susceptibility, to proteolysis is used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide derivatives inhibition of protease activity. The tropoelastin derivative derivatives, and other polypeptides containing tropoelastin derivative. derived protease-susceptibility sites, are useful in human or veterinary medicine, cosmetics (e.g. antiwrinkle or hand lotions), as bulking agents and for inducing chemotaxis. They are also useful for proliferation or

O
growth inhibition, particularly of smooth muscle cells, epithelial or endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. Peptidomimetics that mimic the protease cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit protease activity that causes blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, pharmaceutical, diagnostic, gene therapy, tissue regeneration,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polynucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide peptide of the polynucleotide by contacting the polypeptide or peptide peptide of the polynucleotide by contacting the polynucleotide in an with the antibody of the encoded protein, and observing the binding expressible manner and an antisense polynucleotide. The oligonucleotide expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe for detecting the polynucleotides and encoded proteins are useful as pharmaceutical agents and many disease-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Otsuki T, Wakamatsu A, Sato H, Ishii S;

genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell regeneration. Membrane proteins, signal transduction-related proteins, transcription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the

macromolecular binding properties, useful e.g. as surgical implants. New derivatives of human tropoelastin - with elastin-like or

Claim 7; Fig 3; 82pp; English

The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells contraining vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, planamaceutical, veterinary and cosmetic applications, e.g. as antiproducts. The hybrid protein have controllable GAG-binding properties, products. The hybrid protein have controllable GAG-binding properties, peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELdeltamodified

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM05959-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        for

or New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and in chromosome mapping, tissue typing pharmacogenomics.

Claim 1; SEQ ID NO 40; 560pp; English.

The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive,

Sequence 698 AA;

ö atherosclerosis, hypertension, cancer, obserty, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Albinimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may hybridiseation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention. The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins conteating the derivatives are useful in medical, planamaceutical, veterinary and cosmetic applications, e.g. as antiwirkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated human tropoelastin variant SHELdelta26A Tropoelastin; hTE; elastin; glycosaminoglycan; GAG-binding; medical; pharmaceutical; veterinary; cosmetic application; anti-wrinkle; food; hand lotion; surgical implant; industrial product; human; SHEL; variant. neuroprotective, nootropic, antiparkinsonian, antiasthmatic and gynaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, Gaps macromolecular binding properties, useful e.g. as surgical implants. immunosuppressive, anti-HIV, . 0 New derivatives of human tropoelastin - with elastin-like or Length 692; Indels 510 AAAGLGAGIPGLGVGVGVPGLGVGAGVPGLGVGAGVPGFGA 550 41 1 AAAGLGAGIPGLGVGVGVPGLGVGAGVPGLGVGAGVPGFGA .. ```
The present sequence represents a human reduced tropoelastin derivative, certificated SHEL-delta-26a. The sequence is produced by removing exon 26a of SHEL (SHEL not defined). The protein is representative of tropoelastin derivatives of the invention, in which a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a consequence has been inserted so that susceptibility, to proteolysis is reduced or eliminated, or a consequence has been inserted so that susceptibility, or proteolysis is increased. The derivatives protein would be degraded too easily, e.g. in context with serum or wound exidate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivative competitive inhibition of protease activity. The tropoelastin derivative derivation, particularly sites, are useful in human or veterinary derived protease-susceptibility sites, are useful in human or veterinary condition, particularly of smooth muscle cells, epithelial or growth inhibition, particularly of smooth muscle cells, epithelial or conductuatives are competitive inhibitores of the protease cleavage site in tropoelastin protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit controlling proteins blood clotting

```

The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypocensive, cytostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, nootropic, antiparkinsonian, antiasthmatic and gynaecological activities and may be useful in diagnosing, treating or preventing NOVX-associated disorders including cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may be utilised as vaccines whilst the nucleic acids may be used as hybridisation probes, in gene therapy, chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of the human NOV protein of the invention.

Blastin based compositions useful for treating atherosclerosis, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm, dissection SVAS and/or hypertension.

Example 3; Page 46; 79pp; English.

The present sequence represents a human elastin. Peptides derived from elastin are used in compositions of the invention. The specification

ò
describes elastin based compositions that are potent regulators of smooth muscle cell proliferation, differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastins, tropoelastins (or fragments of them) which have biological activities comprising: inhibiting the proliferation of smooth muscle cells in vivo; stimulating the migration of smooth muscle cell in vivo; and regulating the migration of smooth muscle cell in vivo. The compositions may be used for the prophylaxis or treatment of a disorder characterized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a fusion protein, comprising human clastin and c-myc, preceded by a His tag. The protein is used in compositions of the invention. The specification describes elastin based proliferations that are potent regulators of smooth muscle cell proliferation, differentiation and migration in vivo. The elastin-based proliferations compositions compositions to a least one elastic fibre, elastins, tropoelastins (or fragments of them) which have biological activities comprising: inhibiting the proliferation of smooth muscle cells in vivo; stimulating the differentiation of smooth muscle cell in vivo; and regulating the
                                                                                                                                                                  by diminished capacity to regulate smooth muscle cell function such as atherosclerosis, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tropoelastin; elastin, elastic fibre, smooth muscle cell proliferation, smooth muscle cell differentiation; smooth muscle cell migration; smooth muscle cell function; atherosclerosis; restenosis, aneurysm; vascular bypass graft stenosis; transplant arteriopathy; dissection; SVAS; hypertension; transplant arteriopathy.

The present invention relates to a method for the in vitro diagnosis of endometriosis by determining the amount of gene product from at least one specific gene in a patient sample and comparing this with the amount of gene product in a control sample. A reduced level is indicative of endometriosis. The gene products may be fibronectin, p27, reticulocalbin, aldehyda dehydrogenase 6, gravin, phospholipase C epsilon, elastin, insulin-like growth factor binding protein-2, alpha-2 type IV collagen, transmembrane receptor PTK7, collagen type XVIII alpha 1, platelet derived growth factor receptor alpha, laminin M chain, subtilishin like protein PACE4 or nidogen. The method is useful for initial diagnosis of endometriosis, and also for monitoring progress and treatment of the disease. The present sequence is human elastin
migration of smooth muscle cells in vivo. The compositions may be used for the prophylaxis or treatment of a disorder characterized by diminished capacity to regulate smooth muscle cell function such as atherosclerosis, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 monitoring of endometriosis, comprises detecting specific gene products, e.g. from the fibronectin

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcoma. The method of the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma upregulated protein of the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

```

New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed. The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein Claim 20; SEQ ID NO 1593; 1177pp; English.

(first entry) 23-MAY-2001

Human membrane or secretory protein clone PSEC0191.

Human; secretory protein; membrane protein; vaccine; gene therapy; rheumatoid arthritis; diabetes.

```
which encode human secretory or membrane proteins represented by AAB88117

- AAB88419. Included in the invention are primers AAF93917 - AAF94295 and
- AAB88419. Included in the invention are primers AAF93917 - AAF94295 and
invention. The invention also includes methods for the production of
antibodies directed against the proteins, and cDNA sequences of the
antibodies directed against the proteins, and cDNA sequences, which can
be used in vaccines. The polymucleotide sequences can be used in gene
therapy. The polymucleotide sequences and the proteins they encode may be
therapy. The provention, treatment and diagnosis of diseases associated
with inappropriate secretory protein/membrane protein expression. The
with inappropriate secretory protein/membrane protein expression. The
nucleic acids and complementary sequences may also be used to suddy the expression and function of secretory
companies of used to study the expression and function of secretory
proteins/membrane polypeptides and their role in metabolism. The
companies of expression and activity. The antibodies and antagonists
also be used as therapeutic agents to down regulate expression and
activity. The antibodies may also be used as diagnostic agents for
antagonists of expression and activity. The antibodies and antagonists
companies of expression and activity. The antibodies and antagonists
companies of expression and activity. The antibodies and antagonists
contivity. The antibodies may also be used as diagnostic agents for
activity. The antibodies may also be used as diagnostic agents for
detecting the presence of the polypeptides in samples (e.g. by enzyme

The invention discloses a composition comprising two or more isolated rat cor thuman polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a which is differentially expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polymptice sides given in the activity in an entend for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more confound that sequence presented is a rat protein (shown in Table 2 of the rappoint (CI) and spared nerve injury (SNI)) in an animal engagemental nerve injury (CMUMS), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal capmental or the sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed cor my more in which is differentially expressed during pain. Note: The sequence data for this patent did not form directly from WIPO at the my more than the correction or mane or more or more or more or more or more or more or more or more or more or more or more or more or more or more or more or more or more or more or more o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence of chemotactic peptides which is incorporated into the surface
                                                                                                                                                                                                                                                                                                                                                                             New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fibroblast, elastic fibres; tissue regeneration; skin tissue;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             71.5%; Score 181; DB 7; Length 864; 78.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated tropoelastin derivatives of the invention a subsequence has been mutated so that susceptibility to proteolysis is subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be increased. The derivatives have with reduced susceptibility, and can be contact with serum or wound extdate. The tropoelastin derivatives provide competitive inhibition of protease activity. The tropoelastin derivatives of derivatives, and other polypeptides containing tropoelastin derivative. The derivative and commercias (e.g. antiwrinkle or hand lotions), as bulking agents and for inducing chemotaxis. They are also useful for proliferation or competitive inhibition, particularly of smooth muscle cells, epithelial or competitive inhibitions of the protease cleavage site in tropoelastin editivatives are competitive inhibitions of the protease, chondrocytes and platelets. Peptidomimetics that mimic the protease cleavage site in tropoelastin controlling against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit propease activity that causes blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

The presence of the chemotactic peptide on the prosthetic device promotes invasion of the prosthesis by fibroblasts capable of synthesising elastic fibres, and so induces incorporation of the device into the regenerating natural tissue (esp.skin or blood vessel walls). The preferred devices contain 1 picomole-1 micromole nonamer (or repeating unit) per 100 square cm of surface, pref. incorporated by non-covalent bonding. (Updated on 099 -JAN-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA
                                                                                                                                                                                                                                                                                                                                                       Prosthesis surface treated with chemo:tactic peptide - to induce invasion by fibroblasts and incorporation into regenerating tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein crystallisation, elastin, collagen, keratin, controlled release,

The present invention describes a composition (C1) comprising: (a) a protein polymer of at least 15kDa which comprises alternating blocks of at least 2 units each of a sequence of 3.30 amino acids which promotes protein crystallisation, and an amino acid sequence which is an elastinalise element, a collagen-like element or a keratin-like element; and (b) form under physiologically active substance. The composition acquires a non-liquid form under physiological conditions. Also described: (1) delivering a biologically active substance to a localized site in vivo, comprising administering C1, where the biologically active substance is delivered camensions of a body tissue of a mammal, comprising administering active composition is used for the controlled release of biologically active compounds in vivo. It can also be used to alter the physical dimensions of a body tissue. The present sequence represents a SELEPRY gene monomer harman alastic and active represents a SELEPRY gene monomer which are also as a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second or a second 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          elastin-like unit, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                 New composition comprising a repetitive polymer containing alternating blocks of sequences that promote protein crystallization and sequences that are elastin, collagen or keratin-like elements, useful for in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pendent group; repeating unit; enzyme recognition site; sealant; fibrin; enzymatic cross-linking; biocompatible material; structural integrity; medical adhesive; wound closure; tissue repair; transglutaminase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

(PROT-) PROTEIN POLYMER TECHNOLOGIES INC.

03-MAR-1994;

```
The sequence of the protein polymer adhesion substrate (PPAS) SELPBK monomer sequence. The gene sequence is altered from the native SELPB sequence (AAQ98718) by the introduction of a polymorphism at pos. 90 of the SELPB sequence. The sequence was used to produce the PPAS SELPBK (AAR80341). The protein can be used as a polymer substrate in a isopeptide cross-linking reaction catalysed by a transglutaninase enzymatic activity, e.g. Factor VIII or XIII. The polymers can be used in biological systems where in situ formation of a biocompatible material biological integrity is required e.g. as medical adhesives and sealants or for wound closure or tissue repair
                                                                                                          Protein polymers comprising repeating units and sequences - capable of enzyme-catalysed covalent bond formation useful as a biocompatible material for wound closure and tissue repair.
                                                                                                                                                                                                        Example 7; Page 63; 138pp; English.

The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated tropoelastin derivatives of the invention a subsequence has been mutated or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be increased. The derivatives have with reduced susceptibility, and can be competitive inhibition of protease activity. The tropoelastin derivatives of erivatives, and other polypeptides containing tropoelastin derivative derivatives and other polypeptides containing tropoelastin derivative derived protease-susceptibility sites, are useful in human or veterinary derived protease-susceptibility sites, are useful in human or veterinary control of commetties (e.g. antiwrinkle or hand lotions), as bulking agents mud of the protease cleavage site in tropoelastin control of protecting state mimic the protease cleavage site in tropoelastin protecting against lung damage caused by elastin, for inhibiting or protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit
                                                                                                                                                                                                                                                                                                Tropoelastin; derivative; proteolysis; protease; antiwrinkle; hand lotion; bulking agent; chemotaxis; proliferation; growth inhibition; peptidomimetic; lung damage; elastin; cancer; metastasis; blood clotting.

The present sequence represents a human tropoelastin derivative, which is representative of tropoelastin derivatives of the invention. In the tropoelastin derivatives of the invention a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is

increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The tropoelastin derivatives provide derivatives, and other polypeptides containing tropoelastin derivatives. Competitive inhibition of protease activity. The tropoelastin derivatives of derived protease-susceptibility sites, are useful in human or veterinary and for inducing chemotaxis. They are also useful for proliferation or and for inducing chemotaxis. They are also useful for proliferation or commential cells, fibroblasts, osteocytes, chondrocytes and platelets. They protease cleavage site in tropoelastin derivatives are competitive inhibitors of the protease, and are used for protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, and are used for controlling localized growth of cancers or metastases, or to limit

                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a derivative or variant of human tropoelastin (hTE) having elastin-like and/or macromolecule (specifically elastin-like and/or macromolecule (specifically elycosaminoglycos (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives pharmaceutical, veterinary and cosmetic applications, e.g. as antipharmaceutical, veterinary and cosmetic applications, e.g. as antiproducts. The hybrid protein have controllable GAG-binding properties, products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated human tropoelastin variant SHELdelta26A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 FPGALVPGGVADAAAAYKAAKAGAGLGGVPGVGGLGVSAGAVVPQPGAGVKPGKVPGVGL 120

The sequence is produced by removing exon 26a designated SHEL-delta-26a. The sequence is produced by removing exon 26a derivatives of the invention, in which a subsequence has been mutated so that susceptibility been mutated so that susceptibility or a subsequence has been inserted so that susceptibility, and can be increased. The derivatives have with reduced susceptibility, and can be increased. The derivatives have with reduced susceptibility, and can be increased. The derivatives are usually be degraded too easily, e.g. in competitive inhibition of protease activity. The tropoelastin derivatives and other polypeptides containing tropoelastin derivative and other polypeptides containing tropoelastin derivative and other polypeptides containing tropoelastin or veterinary derived protease-susceptibility sites, are useful in human or veterinary derived protease-susceptibility sites, are useful in human or veterinary and for inducing chemotaxis. They are also useful for proliferation or and for inducing chemotaxis. They are also useful for proliferation or endothelial cells, fibroblasts, osteocytes, chondrocytes and platelets. Containing and mimic the protease cleavage site in tropoelastin protecting against lung damage caused by elastin, for inhibiting or protecting against lung damage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit contains activity that causes blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New derivatives of tropoelastin useful, e.g. for inducing chemotaxis and

functional unit (MFU)-1 polypeptide of the invention. This MFU-1 is a polypeptide that has at least 3 beta-sheet/ beta-turn structures, but is not a naturally occurring fibrous protein. Each beta-sheet structure has 3-7 (preferably 5-7) amino acids and the MFU polypeptide may include at least 1 amino acid that can take part in crosslinking. The polypeptide at can also be derived from the sequences of animal elastin, lamprin and spider silk protein. The MFU polypeptides can also be derived from the sequences of animal elastin, lamprin and spider silk protein. The MFU polypeptides can also be apprides. They are used to coat prostheses made of animal or synthetic material or metal, particularly for use as blood vessel or heart valve replacements, or high-tensile strength materials, e.g. ropes or parachute cord. Prostheses based on the MFU allow penetration of endothelial cells, so become permanent, living, tissue replacements. The MFU polypeptides have better biccompatibility than Known elastin-based materials. They are well astinal home.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            defined, homogeneous material and are easier to manipulate and produce than full-length elastins. They are non-thrombogenic and non-immunogenic. Materials can be made from 2 or more different MFU polypeptides to allow properties to be tailored for particular applications, e.g. combining the high extensibility of elastin and the high tensile strength of spider
                                                                             This represents the human elastin sequence containing

```
The present sequence represents a human tropoelastin splice form. The specification describes tropoelastin derivatives, in which a subsequence has been mutated so that susceptibility to proteolysis is reduced or eliminated, or a subsequence has been inserted so that susceptibility to proteolysis is increased. The derivatives have with reduced susceptibility, and can be used where the wild-type protein would be cascaptibility, and can be used where the wild-type protein would be degraded too easily, e.g. in contact with serum or wound exudate. The cropoelastin derivatives provide competitive inhibition of protease cativity. The tropoelastin derivatives, and other polypeptides containing tropoelastin derivative drotease-susceptibility sites, are useful for tropoelastin derivatived protease-susceptibility sites, are useful containing tropoelastin derivatived proteins (e.g. antiwinkle or hand consection or growth inhibition, particularly of smooth cuseful for proliferation or growth inhibition, particularly of smooth contained site in tropoelastin derivatives are competitive inhibitors of chondrocytes and platelets. Peptidomimetics that mimic the protease conforting amage caused by elastin, for inhibiting or controlling localized growth of cancers or metastases, or to limit protease activity that causes blood clotting
                                                                                                           Tropoelastin, derivative, proteolysis, protease, antiwrinkle, hand lotion, bulking agent, chemotaxis, proliferation, growth inhibition, peptidomimetic, lung damage, elastin, cancer, metastasis, blood clotting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New derivatives of tropoelastin useful, e.g. for inducing chemotaxis and

This protein is useful in a cosmetic material or a prosthetic material such as prosthesis for blood vessel replacements, for heart valve replacement, tissue replacement, for covering burns, for covering wounds and stents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polypeptides that comprise three beta-sheet/beta-turn structures and are not naturally occurring fibrous protein, used to produce prosthesis suitable for implantation into humans, and cosmetic materials.

                    Human synthetic tropoelastin is susceptible to hydrolytic breakdown of
the crosslinks. Such material may be useful in e.g. surgical
applications, where the gradual loss of material over time is intended.

                                                                                                                                                                           The invention relates to a derivative or variant of human tropoelastin (INTE) having elastin-like and/or macromolecule (specifically glycosaminoglycan (GAG))-binding properties. Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are used to produce the proteins recombinantly. The tropoelastin derivatives or hybrid proteins containing the derivatives are useful in medical, wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, products or absence of a specific fragment, designated sequence of the synthetic human tropoelastin SHEL.

The invention relates to a novel method for diagnosing and analysing a autoimmune disease or arthritides. The method comprises obtaining a autoimmune disease or arthritides. The method comprises obtaining the mENA patient sample containing mENA, analysing gene expression using the mENA that results in a gene expression signature of the mENA, and using that egene expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of or arthritides in the patient, where gene esignature. The invention of further comprises: a treatment of theumatoid arthritis; identification of further than a mouse; diagnosis of rheumatoid arthritis in a mammal other than a mouse; diagnosis of rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; screening the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnosing and analyzing autoimmune disease using gene expression profiles and microarray technology, useful for diagnosing and treating rheumatoid arthritis, lupus, fibrositis, osteoarthritis, fibromyalgia and

efficacy of a candidate drug in vitro for the treatment of collagen-
induced arthritis, and reducing the symptoms associated with collagen-
induced arthritis. The compositions of the invention have the following
activities: immunosuppressive, antirheumatic, antiarthritic, osteopathic,
methods and compositions of the present invention are useful for
rehons and compositions of the present invention are useful for
rheumatoid arthritis, lupus, anthylosing spondylitis, fibrositis,
fibromyalgis, osteoathritis, gout, juvenile rheumatoid arthritis, and an
immune disease caused by an infectious agent. This sequence represents a
protein sequence relating to the genes used in the analysis and treatment
of autoimmune diseases or arthritides. Note: This sequence is not shown
in the specification. It has been supplied in an electronic format from

This invention describes a polypeptide that comprises three beta sheet/beta turn structures and that is not a naturally occurring fibrous protein. The invention also describes a prosthesis comprising an animal, polypeptide, a cosmetic material comprising the polypeptide, a negative polypeptide, an elastic comprising the polypeptide, an elastic comprising the polypeptide, and tensile strength material comprising the polypeptide of material comprising two or more comprising the polypeptide comprising two or more polypeptides selected from (a) a polypeptide consisting essentially of a portion of the polypeptide consisting essentially of a portion of the main acid sequence of an animal elastin comprising at least three beta sheet/beta turns, (c) a polypeptide consisting essentially of a portion of lamprin comprising at least three beta sheets/beta turns, a polypeptide having the primary collaboration of a naturally occurring fibrous protein and a structure of a portion of a naturally occurring fibrous protein and a secondary structure comprising at least three beta sheet/beta turns, secondary structure comprising at least three beta sheet/beta turns, creamed the polypeptide is not a naturally occurring fibrous protein and a where each of the beta sheet/beta turn structures comprises from its contains the protein comprising at least three beta sheet/beta turns, creamed the polypeptide is not a naturally occurring fibrous protein. The minimal functional unit (MTU) of the invention is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fibrous protein. The minimal functional unit (MFU) of the invention is useful to construct human elastin-like prostheses such as tubes for blood vessel replacement and sheets for other uses such as wound or burn healing. Alternatively the MFU can be co-aggregated with other proteins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for example collagen, to provide prosthesis material that resembles the natural structural materials of the body. The MFU based materials is subject to infiltration of cells growing in the patient, including endothelial cells, and the prosthesis can become a permanent living tissue replacement. The material is more blocompatible than other elastin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polypeptide for constructing human elastin-like prostheses such as tubes for blood vessel replacement and sheets for other uses such as wound or burn healing, comprises three beta sheets and three beta turns.
                                                                                  /note= "region specifically claimed in claim 6"

The invention describes a polypeptide (1) comprising a minimal comprised of at least three beta-sheet/beta-turn structures, and at and comprised of at least three beta-sheet/beta-turn structures, and at an east three beta-sheet/beta-turn structures, and not least one amino acid residue that participates in cross-linking, and not construct human elastin-like prostheses such as tubes for blood vessel construct human elastin-like prostheses such as tubes for blood vessel construct human elastin-like prostheses such as tubes for blood vessel construct human elastin. The MFUS can be co-aggregated with other burns or wounds to promote healing. MFUS can be co-aggregated with other proteins, for e.g. collagen, to provide prosthesis material that compressed the natural structural materials of the body. MFUS modeled on resembles the natural structural materials of the body. MFUS modeled on resembles the natural structural materials of constructions, for e.g. a variety of materials, for a number of different applications, for e.g. collagen, with MFUS modeled on human elastin significantly contrast of more biocompatible than other elastin-containing materials. In contrast consubilised fragments of elastin need before, an MFU is a single consubilised fragments of elastin used before, an MFU is non-practical purposes Like other elastin preparations, the MFU is non-thromany composed entirely of a human elastin sequence, MFU is non-thromany composed entirely of a human elastin sequence, mFU is non-thromany composed entirely of a human elastin sequence, mFU is non-thromany composed entirely of a human elastin sequence, mFU is non-thromany composed entirely of a human elastin sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunogenic, thus providing a truly biocompatible material. MFUs modeled immunogenic, thus providing a truly biocompatible material. MFUs modeled on lamprin and other fibrous proteins can be used to make a variety of materials having high tensile strength, elasticity and plasticity of their parent proteins. This is the amino acid sequence of mature human elastin on which the MFU peptides of the invention are based
                            Claim 1; Fig 1B;

The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antitarteriosclerotic, hypocensive, cytostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, notropic, antiparkinsonian, antiasthmatic and preventing NOVX-associated disorders including cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma or fertility disorders. Furthermore, the polypeptides may houtilised as vaccines whilst the nucleic acids may be used as hyperidisation probes, in gene therapy, chromosome mapping, tissue typing, the human NOV protein of the invention.
                                                                                                                                                                                                                                                                                                     Ϊ;

The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual and a normal soft tissue sample from the same or different individual, and a normal soft tissue sample from the samples and comparing the expression of the gene in both soft tissue samples, where a higher level expression of the gene in both soft tissue sample indicates the of protein expression in the first soft tissue sample indicates the cytostatic applications and may be useful for detecting soft tissue carcoma. The method of the invention has acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated protein of the invention. The current sequence is that of a human soft tissue sarcoma-upregulated specification per se but was submitted in CD format by the inventor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121 PGVYPGGVLPGARFPGVGVLPGVPTGAGVKPKAPGVGGAFAGIPGVGPFGGPQPGVPLGY 180
                                                                                                                                                                                                                                                                                                                                            soft tissue sarcoma; cytostatic; gene therapy; vaccine; screening; human.
                        Early detection of soft tissue sarcoma comprises determining expression of a gene in a first soft tissue sample and a normal soft tissue sample and comparing the gene expression, also useful in treating soft tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 GGVPGAIPGGVPGGVFYPGAGLGALGGGGALGPGGKPLKPVPGGLAGAGLGAGLGAFPAVT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for the in vitro diagnosis of endometriosis by determining the amount of gene product from at least one specific gene in a patient sample and comparing this with the amount of gene product in a control sample. A reduced level is indicative of endometriosis. The gene products may be fibronectin, p27, reticulocalbin, aldehyde dehydrogenase 6, gravin, phospholipase C epsilon, elastin, insulin-like growth factor binding protein-2, alpha-2 type IV collagen, transmembrane receptor pff7, collagen type XVIII alpha 1, platelet derived growth factor receptor alpha, laminin M chain, subtilisin like protein PACE4 or nidogen. The method is useful for initial diagnosis of endometriosis, and also for monitoring progress and treatment of the disease. The present sequence is human elastin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

Vascular bypass graft stenosis, transplant arteriopathy, ssection SVAS and/or hypertension. based compositions useful for treating atherosclerosis, restenosis, vascular aneurysm, dissection Elastin

Example 3; Page 46; 79pp; English.

The present sequence represents a human elastin. Peptides derived from elastin are used in compositions of the invention. The specification describes elastin based compositions that are potent regulators of smooth muscle cell proliferation, differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastins, tropoelastins (or fragments of them) which have biological activities comprising: inhibiting the proliferation of smooth muscle cells in vivo;

```
imulating the differentiation of smooth muscle cell in vivo; and gulating the migration of smooth muscle cells in vivo. The compositions Y be used for the prophylaxis or treatment of a disorder characterized diminished capacity to regulate smooth muscle cell function such as
                                                                                                                                                                                                                                                                                                                         180
                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                             146
                                                    atherosclerosis, restenosis, vascular bypass graft stenosis, transplant arteriopathy, aneurysm and/or dissection. Disorders which may be treated also include SVAS (undefined), hypertension, and transplant arteriopathy
                                                                                                                                                                                                                                                                                                                                                     206

                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a fusion protein, comprising human classin and c-myc, preceded by a His tag. The protein is used in compositions of the invention. The specification describes elastin based compositions that are potent regulators of smooth wuscle cell compositions that are potent regulators of smooth wuscle cell compositions differentiation and migration in vivo. The elastin-based compositions comprise at least one elastic fibre, elastins, tropoelastins compositions comprise at least one elastic fibre, elastins, tropoelastins compositions composition of smooth may biological activities comprising; inhibiting the proliferation of smooth muscle cells in vivo; and regulating the che differentiation of smooth muscle cell in vivo; and regulating the migration of smooth muscle cell in vivo; and regulating the for the prophylaxis or treatment of a disorder characterized by for the prophylaxis or treatment of a disorder characterized by atherosclerosis, restenosis, vascular bypass graft stenosis, transplant atteriopathy, aneurysm and/or dissection. Disorders which may be treated are include SVAS (undefined), hypertension, and transplant arteriopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PGVGVGGIPTYGVGAGGFPGFGVGVGGTPGVAGVPGVGGVPGVGGVPGVGGVPGVGTSPEAQAAAA 420

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   d
                                        The invention relates to a novel NOVX polypeptide. The polypeptide of the invention demonstrates cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antidiabetic, immunosuppressive, anti-HIV, neuroprotective, nootropic, antiparkinsonian, antiaschmatic and gynaecological activities and may be useful in diagnosing, treating or atherosclerosis, hyperternsion, cancer, obesity, diabetes, AIDS, multiple atherosclerosis, graft-versus-host disease, allabeimer's disease, Parkinson's be utilised as vaccines whilst the nucleic acids may be used as bybridisation probes, in gene therapy, chromosome mapping, tissue typing, the human NOV protein of the invention.
                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                               141
                                                                                                                                                                                                                                                                                                                                                                     180

The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to compare with endogenous DNA sequences in patients to identify potential genetic disorders. The present amino acid sequence represents a protein
                                                                                                                                                                                                        New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.

Cells containing vectors comprising the nucleic acids encoding the variants or derivatives are comprising the nucleic acids encoding the variants or derivatives are bybrid proteins containing the derivatives are useful in medical, pharmaceutical, veterinary and cosmetic applications, e.g. as anti-wrinkle or hand lotions, also as surgical implants, foods and industrial products. The hybrid protein have controllable GAG-binding properties, depending on presence or absence of a specific fragment, designated peptide 26A, from hTE. The present sequence represents a human tropoelastin derivative SHELdeltamodified

            useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents a protein sequence of the invention.

Human protein encoded by clone NT2RP70003110. 617 ADB64761 standard; protein; (first entry) 04-DEC-2003 ADB64761

Human, pharmaceutical, diagnostic, gene therapy; tissue regeneration, cell regeneration, membrane protein, signal transduction-related protein, transcription-related protein, osteoporosis, neurological disease;

Homo sapiens

EP1308459-A2

28-MAR-2002; 2002EP-00007401.

```
The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel comparison to the polynucleotide, an antibody binding to the polynucleotide or its partial peptide, immunologically assaying the polypeptide or peptide of the polynucleotide, immunologically assaying the polypeptide or peptide of with the antibody of the encoded protein, and observing the binding expressible manner and an antisense polynucleotide. The oligonucleotide in an expressible manner and an antisense polynucleotide. The oligonucleotide of detecting the polyvucleotide. The polynucleotide or as a probe of the encoded proteins are useful as pharmaceutical agents and many disease-related proteins are useful as pharmaceutical agents and many disease-related of genes may be included in them, for developing a diagnostic marker or of gene therapy. The genes are involved in tissue and activity, or as targets respendence for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and, or cell transcription-related proteins, signal transduction-related proteins, diseases (e.g. osteoporosis, encoding them can be used as indicators for diseases (e.g. osteoporosis, the activity or expression of the encoded proteins and sequence data for this patent is not represented in the printed burnar nature of the protein of the invention. Note: Some of the privated privation is patent is not represented in the printed burnar nature.

The invention discloses a composition comprising two or more isolated rat cor human polymucleotides or a polymucleotide which represents a fragment, or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence comprising the vector identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a corporate of that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates subjected to pain, a method for producing is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a polymucleotides equence which is differentially compound that regulates the activity of one or more of the composition, a pecification, a method for producing a pharmaceutical composition, a cutivity in an animal of one or more of the polypeptides of identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides or method for identifying a compound that composition comprising the one or more pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for prepazing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at

à g à 엄 8 g This invention relates to nucleic acid sequences AAF93744 - AAF93916

which encode human secretory or membrane proteins represented by AAB88317

- AAB88419. Included in the invention are primers AAF93917 - AAF94295 and

AAF62232 - AAF62235 which are used to isolate the cDNA sequences of the

invention. The invention also includes methods for the production of

antibodies directed against the proteins, and cDNA sequences of the

antibodies directed against the proteins, and cDNA sequences. Which can

therapy. The polynucleotide sequences can be used in gene

therapy. The polynucleotide sequences and the proteins they encode may be

cused in the prevention, treatment and diagnosis of diseases associated

with inappropriate secretory protein/membrane protein expression. The

nucleic acids and complementary sequences may also be used as DNA probes

in diagnostic assays (e.g. polymerase chain reactions (PCR) to detect

and quantitate the presence of similar nucleic acid sequences in samples.

Chey may also be used to study the expression and function of secretory

proteins/membrane polypeptides and their role in metabolism. The

proteins/membrane polypeptides and their role in metabolism. 5 120 9 87 polypeptides may be used as antigens in the production of antibodies against them and in assays to identify modulators (agonists and antagonists) of expression and activity. The antibodies and antagonists may also be used as therapeutic agents to down regulate expression and activity. The antibodies may also be used as agines for detecting the presence of the polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA). Examples of diseases which may be treated include rheumatoid arthritis and diabetes 81 acids encoding secretory proteins/membrane proteins, useful in 1 GGVPGAIPGGVFGGVFYPGAGLGALGGGALGPGGKPLKPVPGGLAGAGLGAGLGAFPAVT 27 GGVPGAIPGGVPGGVPYPGAGLGALGGGALGPGGKPLKPVPGGLAGAGLGA----61 FPGALVPGGVADAAAAYKAAKAGAGLGGVPGVGGLGVSAGAVVPQPGAGVKPGKVPGVGL 2; Indels 226; Gaps Hayashi K; gene therapy or as candidate target molecules in drug development 49.0%; Score 1314; DB 4; Length 472; 55.1%; Pred. The polymer has an inverse temperature, and is injected in water solution at coacervate concentration. The polymer is injected at periurehral or subdermal sites (for treatment of urinary incontinence or for cosmetic purposes), or into application is restoration of intervertebral discs. Polymer IV has a Tt value of 28 deg AMUSMENTATION OF restoration of mammalian tissue by injecting solution of peptide polymer, used for soft or hard tissue reconstruction, especially of intervertebral disks. 361 PGVGVGGIPTYGVGAGGFPGFGVGVGGIPGVAGVPSVGGVPGVGGVPGVGISPEAQAAAA 421 AKAAKYGVGTPAAAAKAAAKAAQFGLVPGVGVAPGVGVAPGVGVAPGVGLAPGVGVAPG Elastomer; bioelastomer; polymer IV; tissue augmentation; tissue restoration; tissue reconstruction; tissue repair; implant; fibronectin cell attachment site. 481 VGVAPGVGVAPGIGPGGVAAAKSAAKVAAKAQLR 515 281 VGVAPGVGVAPGIGPGGVAAAAKSAAKVAAKAQLR 315 Alanine-containing elastomer, polymer IV. The sequences represented by AAR80251-R80257 are polymers constructed of repeating blocks of fibroin-like (see repeating blocks of fibroin-like (see aAR80250) units. This sequence contains 13 repeats of a block consisting canded and the sequence contains and a block consisting contains of a block consisting and a sequence sencoding these polymers were inserted into plasmids which were sequences encoding these polymers were inserted into plasmids which were used to transform E.coli strain EC3. The polymers could then be isolated to polymers are used to form a device (such as a suture, pin, thread, gel or polymers are used to form a device (such as a suture, pin, thread, gel or confine the two repetative units, and by altering the lengths of the blocks of of the two repetative units, and by altering the lengths of the blocks of cach of them. The tensile properties of the polymer can altered moderatly. By reducing the number of repeating units of this sequence, or by increasing the number of units of the polymers signed (see AAR8025) and the fastest resorption rate. The SELP4 (see AAR8025) and SELP5 (see had the fastest resorption rate. The SELP4 (see AAR8025) and selP5 (see three polymers showed intermediate resorption. No data was given for certain the conternance.
Protein polymer comprising alternating blocks of fibroin and elastin
units - used to form a device e.g. a suture to keep separated viable

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a composition (C1) comprising: (a) a protein polymer of at least 15kDa which comprises alternating blocks of at least 2 units each of a sequence of 3.30 amino acids which promotes protein crystallisation, and an amino acid sequence which is an elastin-like element, a collagen-like element or a keratin-like element, and (b) a biologically active substance. The composition acquires a non-liquid form under physiological conditions. Also described: (1) delivering a biologically active substance to a localized site in vivo, comprising a diministering C1, where the biologically active substance is delivered from the non-liquid to the localized site; and (2) altering the physical from the non-liquid to the localized site; and (2) altering the physical composition is used for the compression administering a C1.

The composition is used for the controlled release of biologically active compounds in vivo. It can also be used to alter the physical dimensions of a body tissue. The present sequence represents a protein polymer block amino acid sequence from the present invention
                                                                                                                                                                                                                                                                                                   Protein crystallisation; elastin; collagen; keratin; controlled release;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               105
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        149

the sequences teptescented by Annovesi-roves, are polygicis consistuated of repeating blocks of fibroin-like (see AAR80249) and elastin-like (see AAR80250) units. This sequence contains 13 repeats of a block consisting of 8 elastin-like repeats followed by 4 fibroin-like repeats. The DNA consisting sequences encoding these polymers were inserted into plasmids which were used to transform E.coli strain EG3. The polymers could then be isolated from the fermented strains by standard centrifugation techniques. The polymers are used to form a device (such as a suture, pin, thread, gel or film) to keep separated viable tissue together. By varying the the ratio of the two repetative units, and by altering the lengths of the blocks of cach of them, the tensile properties of the polymer can altered moderatly. By reducing the number of repeating units of this sequence, or by increasing the number of units of the polymers afaster by increasing the number of the search like repeat, a faster of rate of resorption can be achieved. Of the polymers SELPO (see AAR80251) and the fastest resorption rate. The SELP4 (see AAR80255) and SELP5 (see AAR80255) polymers showed intermediate resorption. No data was given for three forms.) sequences represented by AAR80251-R80257 are polymers constructed of (see AAR80257 three J SELP6

The present invention describes a composition (CI) comprising: (a) a protein polymer of at least 15kDa which comprises alternating blocks of at least 2 units each of a sequence of 3-30 amino acids which promotes or protein crystallisation, and an amino acid sequence which is an elasting like element, a collagen-like element or a keratin-like element, and (b) like element, a collagen-like element or a keratin-like element; and (b) composition acquires a non-liquid composition acquires a non-liquid composition acquires a non-liquid composition acquires a non-liquid composition acquires a non-liquid composition acquires a non-liquid composition acquires a non-liquid composition and administering a composition is used for the localized site in vivo, comprising all composition is used for the controlled release of biologically active compounds in vivo. It can also be used to alter the physical dimensions compounds in vivo. It can also be used to alter the physical dimensions of a manner of a present sequence represents a protein polymer block are not alter the physical dimensions of a proper present a sequence represents a protein polymer block are presented and account of the present and account of the present a protein polymer block are not account of the present a protein polymer block are not account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account of the present and account
